

## Lab 6

## Exercise 1

- Code for our Jacobi function is inside of lib.py
- For  $b$  as  $[1,1,1]$ , we get our  $x$  as  $[0.09018568 \ 0.0265252 \ 0.02387268]$ , and we know this works since  $A * x$  does equal our  $b$  value.

## Exercise 2

- Code for our Gauss Seidel is inside of lib.py
- For  $b$  as  $[1,1,1]$ , we get our  $x$  as  $[0.09018568 \ 0.0265252 \ 0.02387268]$ , and we know this works since we got the exact same thing for our previous solution.

### Exercise 3

- Jacobi and Gauss Seidel got  $x$  as  $[1. -2. 3. 1. 5.]$ . Jacobi needed total of 42 iterations and Gauss Seidel needed a total of 22 iterations.

## Exercise 4

- Jacobi and Gauss Seidel both got the final solution of:

[illegible]

## Exercise 5:
