Lab 5

Exercise 1:

- The LUFactorization function is inside of the lib.py file.
- The matrix I used for testing is:

[[1, 2, 3], [4, 5, 6], [7, 8, 9]]

The reason I know this works is because once it is factored into L and U, when you multiply them back together, you get the original matrix,

Exercise 3:

- The LUx function is inside of the lib.py file.
- The matrix I used for testing is:

[[2, 1, 1], [1, 2, 1], [1, 1, 2]]

The b values are 7, 8, 9.

• The system of equations looks like:

$$2x1 + x2 + x3 = 7$$

 $x1 + 2x2 + x3 = 8$
 $x1 + x2 + 2x3 = 9$

where x1 = 1, x2 = 2, and x3 = 3. I plug the values back in and I get those numbers.

Exercise 5:

• Solution is [1.0, 1.0, 1.0, 1.0, 1.0]

Exercise 6:

• Solution is [2.05797, -0.724637, -0.391304, 0.594203, 0.42029]

Exercise 7:

Solution is [0.211325, 0.154701, 0.169873, 0.165808, 0.166897, 0.166605, 0.166683, 0.166662, 0.166668, 0.166666, 0.166667, 0.16
